Motivation

- Theory Existing literature
 - Fiscal austerity literature in AMs
 - Front-loaded consolidation & no restructuring
 - Sovereign debt literature
 - Back-loaded consolidation & default/restructuring
- Data Three strategies
 - Front-loaded consolidation & no restructuring
 - Front-loaded consolidation & preemptive restructuring
 - Back-loaded consolidation & post-default restructuring
- Question How can we fill a gap between theory and data?

What We Do in This Paper

- Empirical, theoretical, and quantitative paper
- Empirics
 - Data on strategies of expenditure consolidation and restructurings
 - New stylized facts
- Theory
 - Sovereign debt model with preemptive and post-default restructurings and public capital
 - (i) front-loaded & preemptive, (ii) front-loaded & no restructuring
 - Choice between front- and back-loaded expenditure consolidation
- Quantitative analysis
 - Replication of the five stylized facts

Data: Debt Restructurings and Debt Distress

- Debt Restructurings Asonuma and Trebesch (2016)
 - 197 sovereign debt restructurings in 1975-2020
 - Post-default restructurings: 116 episodes
 - Preemptive restructurings: 81 episodes
- Non-restructuring Debt Distress New
 - 25 episodes in 1975–2020
 - High likelihood of restructurings
 - (i) EMBIG bond spreads
 - (ii) Estimated restructuring probability (probit regression)
 - No overlap with restructuring
 - Debt distress being cured (an interval of at least 2 years)

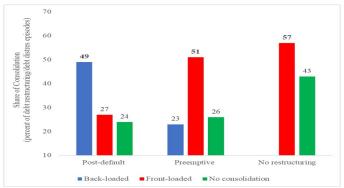

Data: Expenditure Consolidation

- Public expenditure composition data Asonuma and Joo (2021)
 - Consumption, transfers, investment and capital in 1975-2020
- Expenditure consolidation:
 - Alesina and Perotti (1997)- cyclically adjusted expenditure/GDP
 - Alternative classification expenditure /lagged GDP
 - Criteria:
 - 1) The indicator falls more than 1.5 percent
 - 2) It falls at least 1.25 percent a year in two consecutive years
- Front- and back-loaded expenditure consolidation
 - Front-loaded prior to start of restructuring (year t-2, or t-1)
 - Back-loaded after start of restructuring (year t, t+1,...)

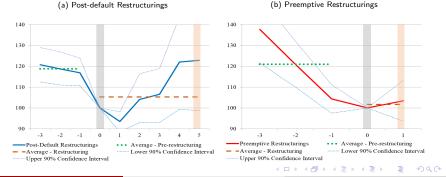

Data: Strategies of Consolidation and Restructurings

- 8 strategies of expenditure consolidation and debt restructuring
 - Post-default + back-loaded consolidation
 - Post-default + front-loaded consolidation
 - Post-default + no consolidation
 - Preemptive + back-loaded consolidation
 - Preemptive + front-loaded consolidation
 - Preemptive + no consolidation
 - Debt distress/no restructuring + front-loaded consolidation
 - Debt distress/no restructuring + no consolidation
- 3 strategies are the majority

 Stylized Fact 1: Three strategies of expenditure consolidation and debt restructuring are dominant

- **Stylized Fact 2**: Public investment declines sharply ex ante in preemptive cases, while ex post in post-default cases
- Stylized Fact 3: Debt settlement takes place before recoveries in public investment in preemptive cases, while after in post-default cases

• **Stylized Fact 4**: Public consumption and transfers decline temporarily ex post and recover quickly in both cases

Main Questions

- Why front-loaded consolidation is associated with a preemptive restructuring, while back-loaded consolidation is associated with a post-default restructuring?
- Why is not more expenditure consolidation front-loaded, if it accompanies with quick debt resolution (i.e., preemptive)?

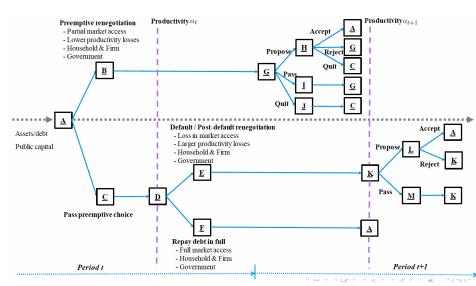

Literature Review

- Fiscal austerity (consolidation)
 - Alesina et al. (2019), Vegh et al. (2019), Guajardo et al. (2014)
 - Ours: Outcomes of two types of expenditure consolidation
- Sovereign debt/default and fiscal policy
 - Cuadra et al. (2010), Arellano and Bai (2017), Hatchondo et al. (forthcoming), Bianchi et al. (2020)
 - Ours: Front-loaded expenditure consolidation (i.e., prior to debt crises)
- Different types of sovereign defaults/debt restructurings
 - Arellano et al. (2019), Hatchondo et al. (2014), Asonuma and Trebesch (2016)
 - Ours: Joint choice on expenditure consolidation and restructuring

Theoretical Findings

- Preemptive restructurings take place when probability of future default is high
 - Creditors accept debt relief because it increases expected repayment
 - move to the "good side (upward sloping) of the debt Laffer curve"
- Preemptive restructurings
 - are predictable, so public investment starts falling earlier on (front-loaded) resulting in larger effective costs of default.
 - associate with smaller TFP losses, so public investment does not fall afterward (quick recovery)
- Defaults/post-default restructurings take place when there is a large, unexpected negative TFP shock
 - Why unexpected? because otherwise there would have been a preemptive restructuring before the shock
- Defaults/Post-default restructurings
 - are unpredictable, so public investment does not start falling earlier on
 - associate with larger TFP losses, so public investment falls sharply (back-loaded)

Model: Timing

Model: Sovereign's Problem - Ex Ante

Ex ante value of sovereign

$$V^{EXANTE}(b_t, k_t^g, 0, a_{t-1}) = max[V^{PRE}(b_t, k_t^g, 0, a_{t-1}), V^{NON_PRE}(b_t, k_t^g, 0, a_{t-1})]$$
 (6)

Ex ante value of taking a preemptive restructuring

$$V^{PRE}(b_t, k_t^g, 0, a_{t-1}) = \max_{g_t, k_{t+1}^g, T_t} \int_A [(1 - \omega)u(c_t, l_t) + \omega v(g_t) + \beta \Psi(b_t, k_{t+1}^g, 1, a_t)] d\mu(a_t | a_{t-1})$$
(7)

s.t.
$$g_t + k_{t+1}^g + T_t = \tau c_t + (1 - \delta^k) k_t^g - \frac{\Omega}{2} (\frac{k_{t+1}^g - k_t^g}{k_t^g})^2 k_t^g$$
 (8)

$$T_t \ge 0 \tag{9}$$

$$\frac{u_{l}(c_{t}, l_{t})}{u_{c}(c_{t}, l_{t})} = \frac{\alpha_{l} \hat{a}_{t}(l_{t})^{\alpha_{l} - 1} (k_{t}^{g})^{\alpha_{k}} (\bar{k}^{p})^{1 - \alpha_{l} - \alpha_{k}}}{1 + \tau}$$
(10)

$$(1+\tau)c_t = \hat{\mathbf{y}}_t + T_t \tag{11}$$

Model: Sovereign's Problem - Ex Ante

Ex ante value of passing a preemptive option

$$V^{NON_PRE}(b_t, k_t^g, 0, a_{t-1}) = \int_A V(b_t, k_t^g, 0, a_t) d\mu(a_t | a_{t-1})$$
 (12)

Preemptive restructuring choice

$$PRE(b_t, k_t^g, 0) = \{a_{t-1} \in A : V^{PRE}(b_t, k_t^g, 0, a_{t-1}) \ge V^{NON_PRE}(b_t, k_t^g, 0, a_{t-1})\}$$
(13)

Model: Sovereign's Problem - Ex Post

Ex post value of sovereign

$$V(b_t, k_t^g, 0, a_t) = \max[V^R(b_t, k_t^g, 0, a_t), V^D(b_t, k_t^g, 0, a_t)]$$
(14)

Ex post value of repayment

$$V^{R}(b_{t}, k_{t}^{g}, 0, a_{t}) = \max_{g_{t}, b_{t+1}, k_{t+1}^{g}, T_{t}} (1 - \omega) u(c_{t}, l_{t}) + \omega v(g_{t})$$

$$+ \beta \int_{A} V(b_{t+1}, k_{t+1}^{g}, 0, a_{t+1}) d\mu(a_{t+1}|a_{t})$$
(15)

s.t. (9) and
$$g_t + k_{t+1}^g + T_t + q(b_{t+1}, k_{t+1}^g, 0, a_t)b_{t+1} = \tau c_t + (1 - \delta^k)k_t^g - \frac{\Omega}{2}(\frac{k_{t+1}^g - k_t^g}{k_t^g})^2 k_t^g + b_t$$
 (8a)

$$\frac{u_l(c_t, l_t)}{u_c(c_t, l_t)} = \frac{\alpha_l a_t(l_t)^{\alpha_l - 1} (k_t^g)^{\alpha_k} (\bar{k^p})^{1 - \alpha_l - \alpha_k}}{1 + \tau}$$
(10a)

$$(1+\tau)c_t = y_t + T_t \tag{11a}$$

Model: Sovereign's Problem - Ex Post

Ex post value of defaulting (post-default restructuring)

$$V^{D}(b_{t}, k_{t}^{g}, 0, a_{t}) = \max_{g_{t}, k_{t+1}^{g}, T_{t}} (1 - \omega) u(c_{t}, l_{t}) + \omega v(g_{t})$$

$$+\beta \int_{A} V((1 + r^{*})b_{t}, k_{t+1}^{g}, 2, a_{t+1}) d\mu(a_{t+1}|a_{t})$$
(16)

$$\frac{u_l(c_t, l_t)}{u_c(c_t, l_t)} = \frac{\alpha_l \tilde{\mathbf{a}}_t(l_t)^{\alpha_l - 1} (k_t^g)^{\alpha_k} (\bar{k}^p)^{1 - \alpha_l - \alpha_k}}{1 + \tau}$$
(14a)

$$(1+\tau)c_t = \tilde{\mathbf{y}}_t + T_t \tag{15a}$$

Default/post-default restructuring choice

$$D(b_t, k_t^g, 0) = \{ a_t \in A : V^R(b_t, k_t^g, 0, a_t) < V^D(b_t, k_t^g, 0, a_t) \}$$
 (17)

Quantitative Analysis - Parameters

• TFP - AR(1) process:

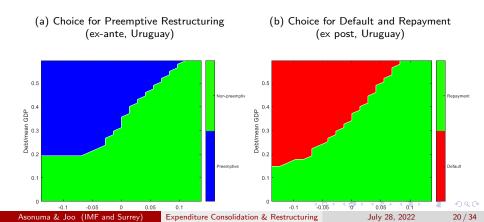

$$\log(a_t) = \rho \log(a_{t-1}) + \epsilon_t, \tag{54}$$

Household utility function - GHH, CRRA:

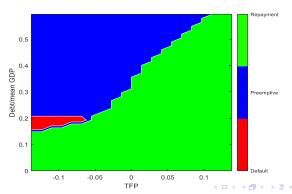

$$u(c_t, l_t) = \frac{(c_t - \frac{l_t^{1+\psi}}{1+\psi})^{1-\sigma}}{1-\sigma}, \qquad v(g_t) = \frac{g_t^{1-\sigma_g}}{1-\sigma_g}$$
 (55)

Parameter	Value	Source			
Risk aversion for private consumption	$\sigma = 3$	Hatchondo et al. (forthcoming)			
Risk aversion for public consumption	$\sigma_g = 3$	Hatchondo et al. (forthcoming)			
Labor elasticity	$\psi = 0.48$	Mendoza (1991)			
Risk-free interest rate	$r^* = 0.01$	Aguiar et al. (2016), Yue (2010) - US Treasury bill rate			
Public capital depreciation rate	$\delta^k = 0.04$	US BEA (1999)			
Direct productivity loss (post-default)	$\lambda_d = 0.05$	Asonuma and Trebesch (2016) - Computed (ARG)			
Direct productivity loss (preemptive)	$\lambda_p = 0.04$	Asonuma and Trebesch (2016) - Computed (URY)			
Country-specific parameters					
Weight on public consumption	$\omega = 0.80 \text{ (ARG)}/0.80 \text{ (URY)}$	Computed (ARG/URY)			
Labor income share	$\alpha^{I} = 0.64 \text{ (ARG)}/0.58 \text{ (URY)}$	Gordon and Guerron-Quintana (ARG)/Computed (URY)			
Public capital income share	$\alpha^k = 0.058 (ARG)/0.11 (URY)$	Computed (ARG/URY)			
Effective consumption tax rate	$\tau = 0.33 (ARG)/0.33 (URY)$	Computed - IMF WEO (ARG/URY)			
Public capital adjustment costs	$\Omega = 10 \text{ (ARG)/10 (URY)}$	Computed (ARG/URY)			
Auto-correlation of productivity shock	$\rho = 0.85 \text{ (ARG) } / 0.90 \text{ (URY)}$	Computed - MECON (ARG)/ BCU (URY)			
Standard deviation of productivity shock	$\sigma^a = 0.017 \text{ (ARG) } / 0.015 \text{ (URY)}$	Computed - MECON (ARG)/ BCU (URY)			
Bargaining power	$\phi = 0.93 (ARG)/0.70 (URY)$	Computed (ARG/URY)			
Discount rate	$\beta = 0.80 \text{ (ARG)}/0.80 \text{ (URY)}$	Computed (ARG/URY)			

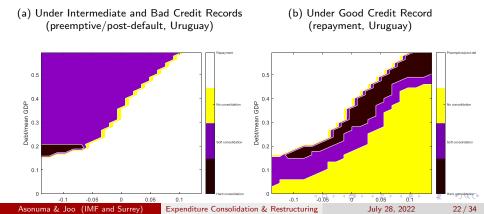

- Debtor's choice between preemptive and non-preemptive and between repayment and default - Mean public capital
 - Preemptive when debt is high and TFP is low
 - Default when debt is high and TFP is low

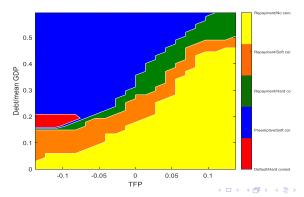

- Debtor's choice among preemptive, default and repayment Mean public capital
 - Replication of Asonuma and Trebesch (2016)
 - (c) Choice for Preemptive Restructuring, Default and Repayment (Uruguay)

- Debtor's choice among hard, soft and no expenditure consolidation -Mean public capital
 - Hard consolidation under post-default, soft under preemptive
 - Hard, soft and no consolidation under repayment

- Front-loaded (hard) expenditure consolidation & no restructuring (green)
- Back-loaded (hard) expenditure consolidation & post-default (red)
 - (c) Choice among strategies of expenditure consolidation and restructuring (Uruguay)

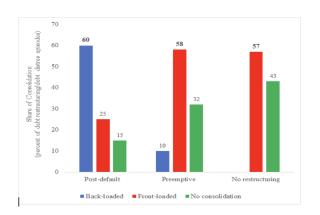

(i) Business Cycle Statistics

	Urugua	ay 2003	Argentina	Argentina 2001-2005	
	Data	Baseline	Data	Baseline	
		Model		Model	
Target statistics

Duration of renegotiations/ exclusion (quarters)	1.0	4.3	14.0	11.2	
Average public investment recovery (quarterly) from t-1 to pre-restructuring level	10.3	7.5	12.0	8.5	

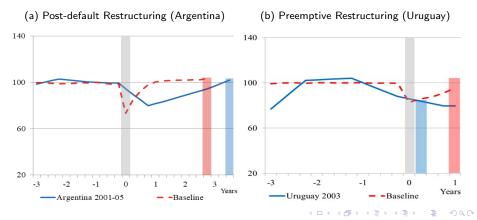

• Strategies of expenditure consolidation and debt restructuring

Public investment around debt restructuring and debt distress

 Public Consumption and Transfers around Restructurings and Debt Distress

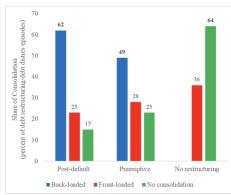

Two Key Determinants

• Role of preemptive restructuring choice and public capital

(i) No Preemptive Restructuring Choice

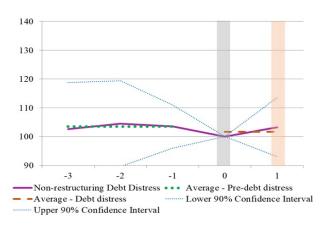

(ii) Fixed Public Capital

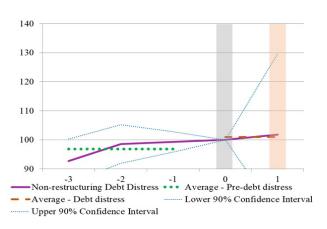

Conclusion

- New data and stylized facts on expenditure consolidation and debt restructurings
- New theoretical explanation on sovereign debt crises and resolution
 - Choice between front- and back-loaded consolidation
 - Role of two types of expenditure consolidation in sovereign debt crises and resolution
- Quantitative analysis of model rationalizes the stylized facts

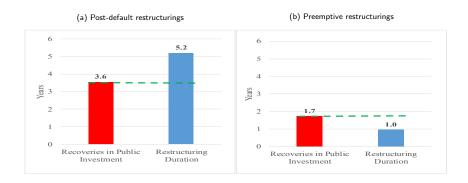

(c) Non-restructuring Debt Distress

(c) Non-restructuring Debt Distress

• **Stylized Fact**: Recoveries in public investment are shorter in preemptive cases than in post-default cases

Recoveries in public investment and restructuring duration

(a) Post-default Restructuring (Argentina) (b) Preemptive Restructurings (Uruguay)
